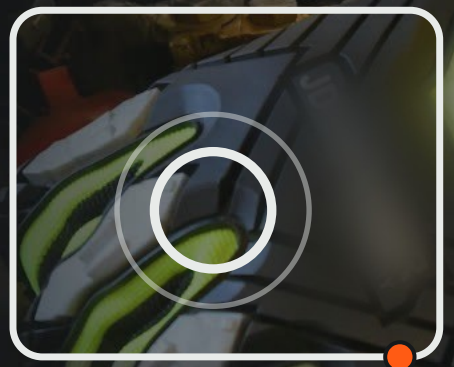
praxis

STEP 4/9

Instructions that can finally see how you're doing

Praxis is an AI coach in smart glasses. It watches new maintenance technicians work and tells them the next step.



Seat the clamp past the hose bead

HARVARD VENTURES · DEMO DAY · OCTOBER 2026 · MONISH SARAVANA

CONCEPT MOCK · STOCK PHOTO

A new maintenance tech needs a year of a senior tech's time before they can work alone

9–14

months before a new tech pays for themselves, in a survey of 35 repair stations

$10–15k

to hire and ramp up one maintenance tech, counting onboarding and lost work

255k

openings a year for US maintenance and repair techs. Each one pulls a senior tech off the floor

> **“The hardest AND most expensive part is training new techs …”** HOSPITAL STERILE PROCESSING ASSOCIATION · OCT 2026

HOW SHOPS HANDLE IT TODAY

Shadowing

A senior tech stands next to the new hire

MISSES About $44 an hour of senior time, for one new tech at a time

Binders, PDFs, YouTube

They explain what should happen

MISSES They can't see what the tech is actually doing

Procedure apps

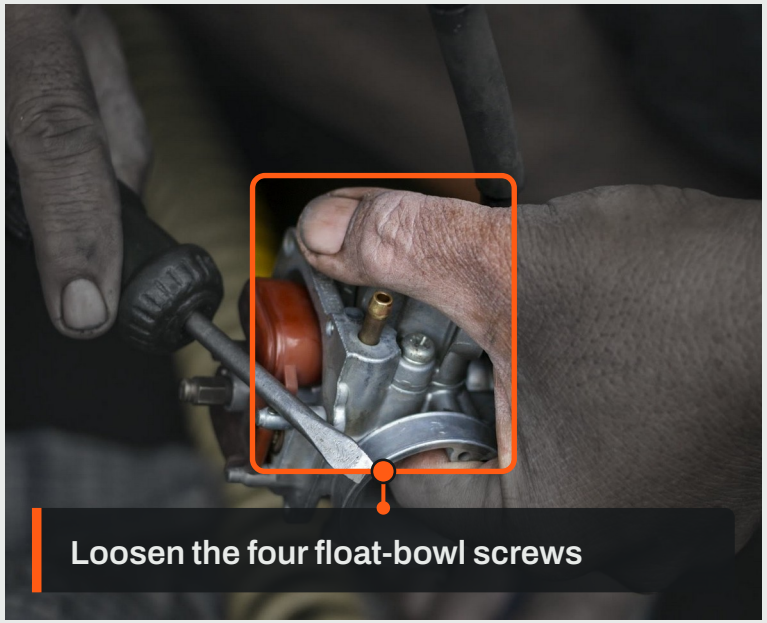
Steps on a phone, with a checkbox

MISSES A ticked box isn't proof the step was done right

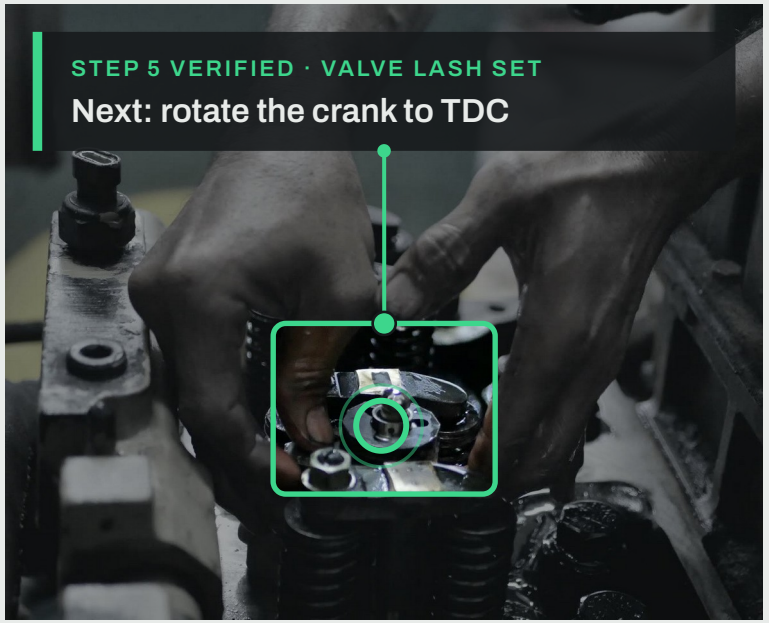
Praxis watches the work and coaches one step at a time

The shop uploads the manuals it already has. The new tech wears smart glasses. Praxis follows along.

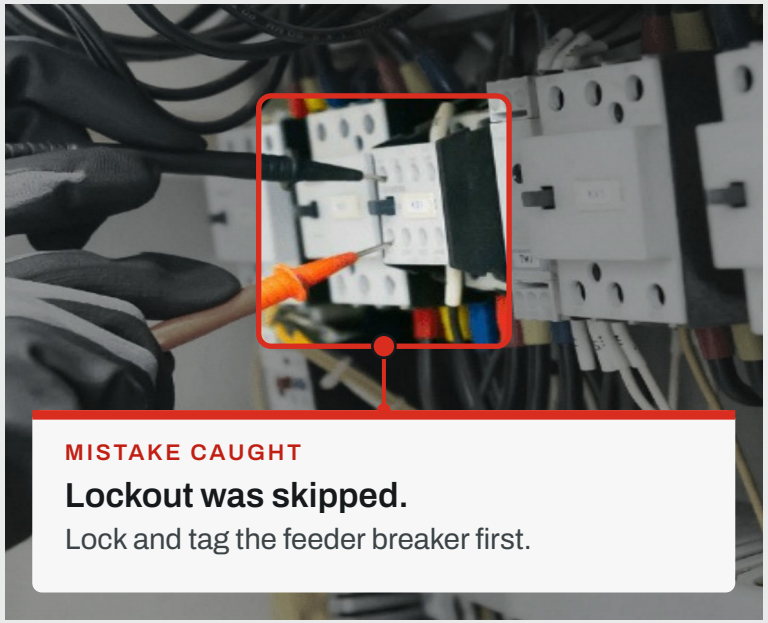
1 Says the next step



2 Checks the work



3 Catches mistakes



BUILT FOR HVAC service · facilities teams · plant maintenance · equipment repair

CONNECTS TO Meta and Viture + NVIDIA smart glasses

Smart glasses took off, and AI got 1,000× cheaper. A coach that sees is finally possible

HOW A NEW TECH LEARNS A PROCEDURE

Paper binders	→	Videos and PDFs	→	Procedure apps	→	**A coach that sees**
Read it, then do it		Watch it, then do it		Tick a box when done		It watches you do it

7×

more AI glasses shipped in two years: about 2.1M in 2024 to 15M+ forecast in 2026. Every pair is a camera we can run on

1,000×

cheaper AI in three years: the same capability fell from $60 to $0.06 per million tokens, so watching a whole shift is affordable

$3.6B

what Autodesk agreed to pay for MaintainX, a maintenance app, in May 2026. In September, Meta opened its glasses' camera to outside apps

A $306M wedge in a $1.8B first market, inside a $9B one

$9.2B TAM

15.4M US workers who follow written procedures

$1.8B SAM

2.47M US maintenance and repair techs

$306M WEDGE

~255k new maintenance techs a year, coached

$4.5M ARR YEAR 3

~3,750 new techs, about 150 teams

WHO BUYS

Maintenance managers at mid-size plants, facilities teams, and HVAC and equipment-service shops

WHO USES IT

The new tech, for their first six months on the job

WHY THEY PAY

A seat costs less than one hour a week of the senior tech who would otherwise teach them

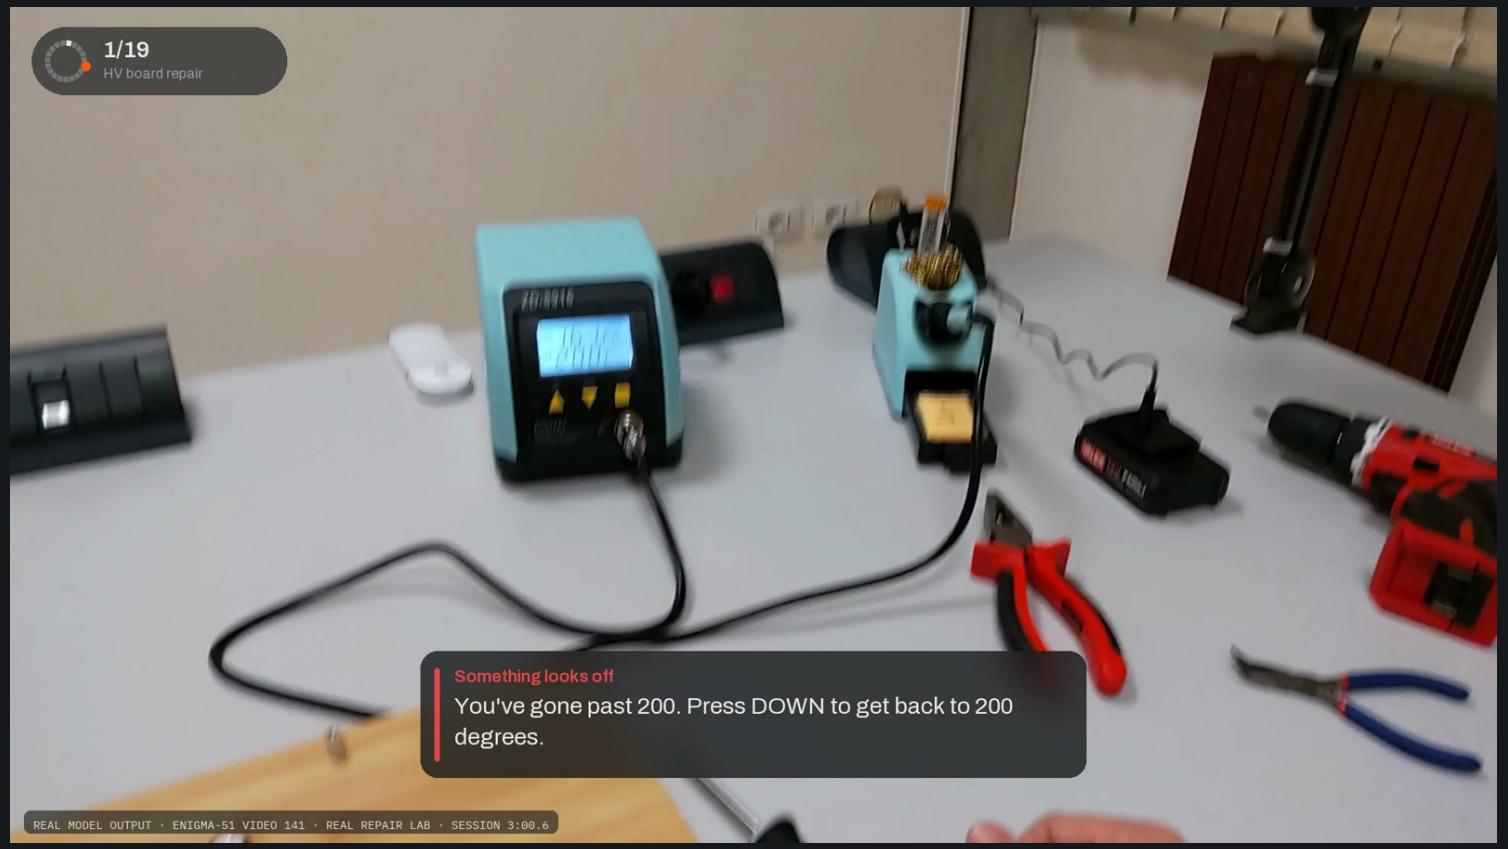
Every option today is missing a piece

	Sees the work a camera on the job	Moves with the tech not bolted to one station	Knows the step you're on follows the procedure	No filming to set up nothing to record or train
Procedure apps MaintainX, Dozuki	○	●	●	●
Fixed cameras Retrocausal, Invisible AI	●	○	●	○
First-person AI glasses Strivr	●	●	●	○
General AI assistants Meta AI, Gemini Live	●	●	○	●
Praxis	●	●	●	●

● has it ○ doesn't

Coming: Viture + NVIDIA coaching glasses ship in Q1 2027. How procedures get into them isn't published.

It already works, live, on a real repair job



Real footage from an industrial repair lab. Every card on screen is the model's own output, from the live session. 49 s, click to play.

13% more

accurate at tracking the step than the same frontier model on its own, at 1/5 the cost

11 of 15

technician questions on a repair job answered right from the company's own manuals

0 times

confidently wrong when the view was blurred or blocked. It asks for a better view instead

$200 a month per new tech. Saving a senior tech one hour a week pays for it

HOW WE MAKE MONEY

1. **A short paid pilot**
   with a metric agreed up front. The fee counts toward year one
2. **$200 per new-tech seat a month**
   billed annually, unlimited sessions. When the tech works alone, the seat moves to the next hire
3. **One-time setup per procedure**
   we compile and check the shop's own manuals
4. **$50 a month for every tech, next**
   skills records for the whole team

WHY IT PAYS FOR ITSELF

$200	≈ $46	≈ 1 hour
a month for a seat	a week	of a senior tech's time ($44)

HOW WE GET CUSTOMERS

Outreach → demo → paid pilot → annual seats

- Direct outreach: 70 maintenance teams and programs this week
- Trade schools: students bring Praxis to their first job. A fiber-optic school is open to a one-lab trial
- Partners: maintenance apps, distributors, glasses makers

I've built real-time vision on messy video before, and I built this in a week

Monish Saravana

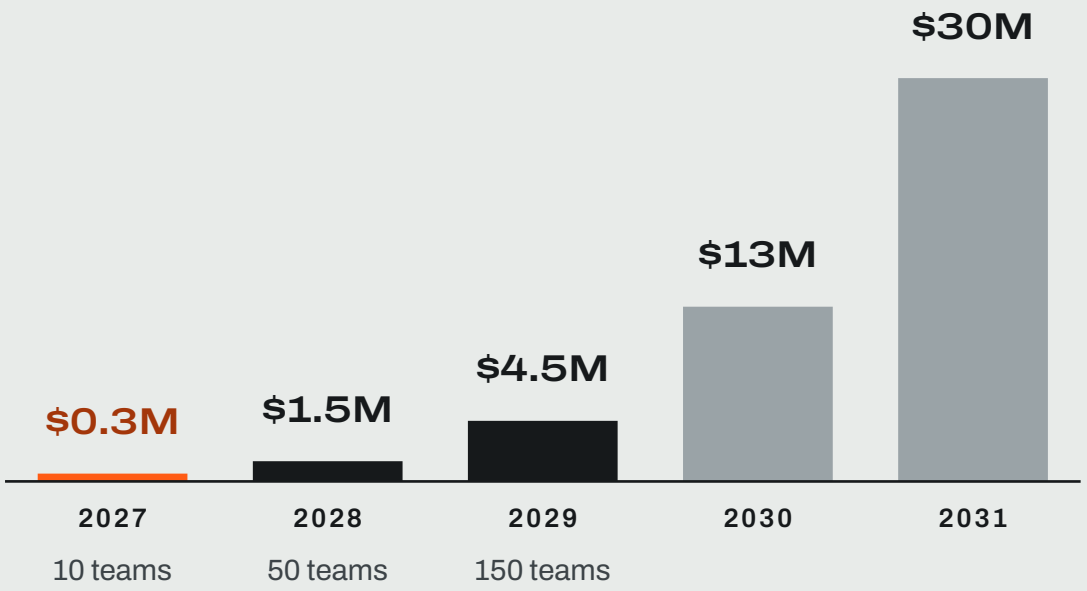
FOUNDER · HARVARD COLLEGE

Solo today. Next: an advisor from the maintenance trade, then first hires after the pilot.

Praxis, in one week	The engine, a 48-video evaluation and a live app, built solo. First commit Oct 17.
LipTrac	Real-time lip reading from ordinary video: 60,000+ frames, 12 testers, provisional patent filed.
7 years of robotics	Competitive robotics, coaching teammates without seeing what they see.
Oil-cleanup boats	Path planning for cleanup boats from aerial imagery.

A path to $4.5M ARR by 2029, at 77–90% gross margin

ARR TARGETS



PER SEAT, PER MONTH

At 2 hours of coaching a day. Our own model takes the routine checks off the rented one. Heavy all-shift use squeezes a flat seat, so we'd price by coached hours.

WHAT THE FIRST $10K BUYS

$3k GPU time · **$2.5k** glasses + capture · **$2k** maintenance training video · **$1.5k** pilot inference · **$1k** company formation

True by April: models retrained on real maintenance video, running on glasses at a real site, and a first paid pilot.

Today we coach the people. Next, the robots

NOW · 2027

Coach new techs

Paid pilots with maintenance teams. Every session becomes labeled training data.

$0.3M · 10 teams

NEXT · 2028

Our own models

Trained on our pilot footage, running on the glasses. Cheaper and better at maintenance than rented models.

$1.5M · 50 teams

THEN · 2029

Certifications through Praxis

Partner with NCCER, NIMS and equipment makers so their hands-on tests run on Praxis. Certified techs bring us their next shop.

$4.5M · 150 teams

LATER · 2030+

Robots

Train robot models on the data we've collected, or sell the data and our step checker to robot labs.

$13M → $30M ARR

Every session records skilled work, step by step. Nobody else has that data, and AI labs pay billions a year for data like it.

FOR Q&A

Appendix

The demo up close, how it works, and the market math, each with the hard questions answered.

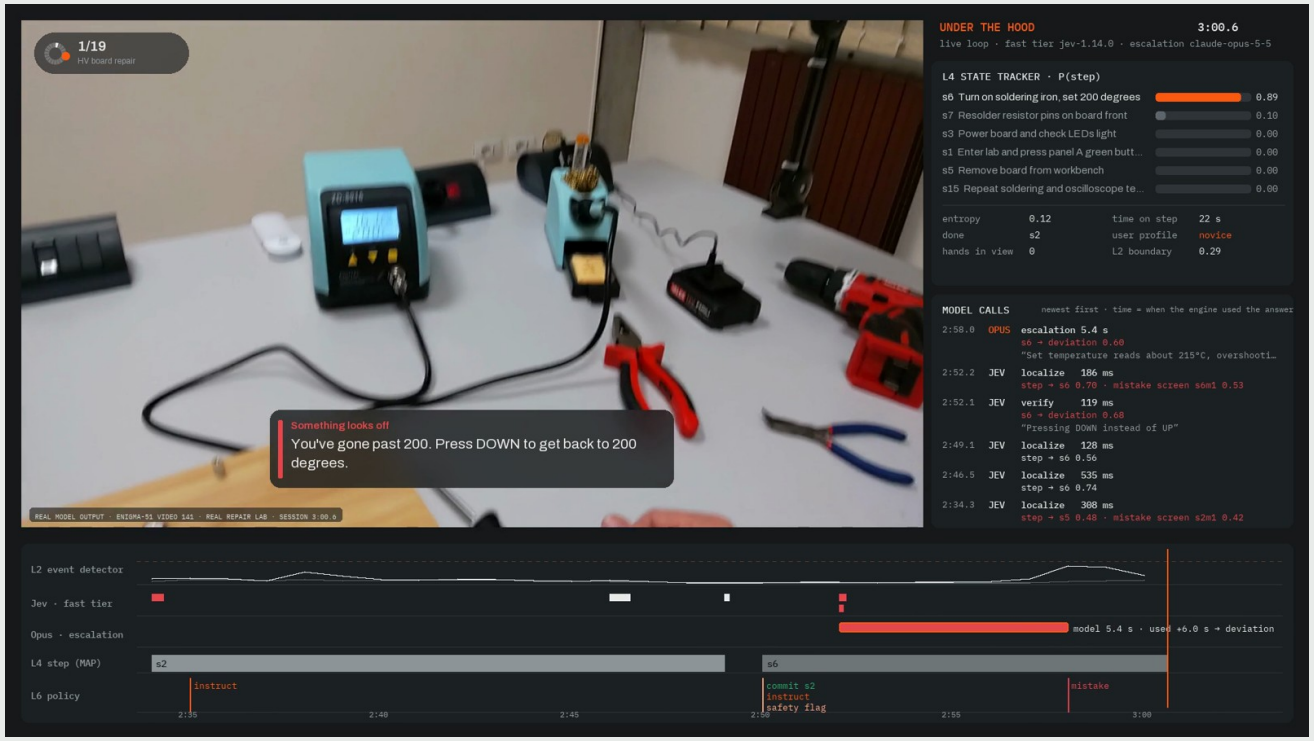
A1 **Under the hood: the live demo**
Is it real? Was it trained on this job? Does it run on glasses?

A2 **How it works**
Is it a wrapper? What's the moat? Why won't big labs build it? How accurate? Safety? Privacy?

A3 **Market math**
How was it sized? Why not consumers? Why would a shop pay? Margins? Customers?

APPENDIX A1

Under the hood: the same live session, layer by layer



50 ms

per frame for our layers, on a laptop

0.15 s · 4 s

fast model, and Opus when it's unsure

$0.165

for the whole 16:40 session

WHAT EACH PART OF THE SCREEN SHOWS

Top right: where it thinks the tech is in the 19 steps, how long they've been on this one, and whether they look new to it.

Middle right: every model call, with its real wait time.

Bottom: the timeline of step detections, model calls and each choice to speak or stay quiet.

IF THEY ASK

Is this real?

Yes. Real footage from an industrial repair lab (ENIGMA-51), streamed through Praxis live. Every card comes from the session log.

Was it trained on this job?

No. It turned the lab's written procedure into steps and coached from those.

Does it run on glasses?

The Meta and Viture + NVIDIA connections are built, with voice control and screen or voice-only modes.

APPENDIX A2

How it works, and the hard questions

THE ENGINE, PART BY PART

OPEN MODEL
Perception
Turns each frame into features

OURS · TRAINED
Step detector
Spots when a step ends

OURS · TRAINED
Task recognizer
Works out which job it is

OURS · TRAINED
Step tracker
Knows where the tech is

OURS · TRAINED
Local checker
Answers routine checks, free

RENTED
Verifier
Hard questions, on 14% of frames

Our parts run on every frame, on the device, in about 50 ms. The rented model is asked only when something happens.

Isn't this just a ChatGPT wrapper?

No. The frontier model is one rented part, asked on 14% of frames and swappable in one line. The tracking, the checks and the data are ours.

What's the moat?

Data nobody sells: first-person video of skilled work, lined up to each step. Customers pay us to collect it, and our step models already improve with it (31% → 51%).

Why won't Big Tech build it?

Meta, Google and OpenAI sell one general model to everyone and give consumer help away free. This takes one trade's manuals, records and on-site pilots. Their glasses become our hardware.

How accurate is it today?

13% more accurate at tracking the step than the same frontier model alone, at 1/5 the cost. Mistake alerts are the weak spot: 4 of 17 named a real error.

What if it's wrong on a safety step?

Lockout and similar steps stay the tech's job: Praxis prompts and records them, and never approves them. When it can't see, it asks for a better view.

Isn't this surveillance?

Our layers run on the device, and only key moments leave it (14% of frames). The tech gets coaching; the employer sees totals, not a live feed.

APPENDIX A3

Market math, and the questions behind it

	WHO (BLS)	MATH	PER YEAR
TAM	Installation, maintenance + repair 6,086,190 · electricians 757,220 · production 8,565,760 = 15.4M	15.4M × $50 a month × 12	≈ $9.2B
SAM	General maintenance + repair, machinery mechanics + millwrights, HVAC = 2.47M jobs, ~255k openings a year	255k × $200 × 6 months = $306M; 2.47M × $50 × 12 = $1.48B	≈ $1.8B
SOM (year 3)	1.5% of new maintenance techs ≈ 3,750 new techs a year, ~150 mid-size teams	3,750 × $200 × 6 months	≈ $4.5M ARR

Assumptions: prices are our hypotheses, anchored on Tulip's $100–250 per station a month. Openings include people changing jobs, so new-tech counts are an upper bound. Not counted: other countries, aviation, and robotics.

Why maintenance, not consumers?

A manager signs a budget, and the same procedure runs every month, so the data compounds. Meta and Google give consumer help away free.

Why would a shop pay $200 a month?

It's about one hour a week of the senior tech who'd otherwise teach ($44 an hour). Hiring and ramping up one tech costs $10–15k.

What are the margins?

About $45 of model cost per seat-month today, so 77%. With our own model, $20, so 90%. All-shift use squeezes that, so we'd price by coached hours.

Any customers yet?

Not yet. Outreach started this week: 70 maintenance teams and training programs, and a fiber-optic school is open to a one-lab trial. The first $10k funds a paid pilot, with a metric agreed up front.
